1 Line search method

2 Step-by-step: Line search method

Example 1. *Examine*

Approach:

3 Step-by-step: standard Newton method

Example 2. Given the following function f as follows

$$f : \begin{cases} \mathbb{R} \rightarrow \mathbb{R}, \\ x \mapsto f(x) := \sqrt{1+x^2}, \end{cases} \quad (1)$$

and the standard Newton method is taken into consideration

$$\begin{cases} x^{(k+1)} = x^{(k)} + \alpha_k d^{(k)} \\ d^{(k)} = -\left(\nabla^2 f(x^{(k)})\right)^{-1} \nabla f(x^{(k)}) \end{cases} \quad (2)$$

(i) Compute 3 steps of the Newton method using $\alpha_k = 1/2$ and $x^{(0)} = -3/2$.

(ii) Given $\alpha_k = 1$. Check all possibilities of the starting points, and examine whether the standard Newton method is converged, diverged, or oscillating.

Approach:

(i) First, we shall need to compute the gradient $\nabla f(x)$ as follows

$$\nabla f(x) = \frac{d}{dx} f(x) = \frac{(1+x^2)'}{2\sqrt{1+x^2}} = \frac{x}{\sqrt{1+x^2}} \quad (3)$$

and the second gradient $\nabla^2 f$ is computed as follows

$$\nabla^2 f(x) = \frac{d^2}{dx^2} f(x) = \frac{d}{dx} \left(\frac{x}{\sqrt{1+x^2}} \right) = (1+x^2)^{-3/2} \quad (4)$$

Next, the direction $d^{(k)}$ for the standard Newton method is ready computed

$$d^{(k)} = -\left(\nabla^2 f(x^{(k)})\right)^{-1} \nabla f(x^{(k)}) \quad (5)$$

$$= -\left(1 + (x^{(k)})^2\right)^{3/2} \frac{x^{(k)}}{\left(1 + (x^{(k)})^2\right)^{1/2}} \quad (6)$$

$$= -x^{(k)} \left(1 + (x^{(k)})^2\right) \quad (7)$$

Then, taking into consideration $\alpha_k = 1/2$ the next step of the standard Newton method takes the form

$$x^{(k+1)} = x^{(k)} + \alpha_k d^{(k)} \quad (8)$$

$$= x^{(k)} - \frac{1}{2} x^{(k)} \left(1 + (x^{(k)})^2\right) \quad (9)$$

With the starting point $x^{(0)} = -3/2$ we gradually obtain the next steps

(a) First step:

$$x^{(1)} = x^{(0)} - \frac{1}{2}x^{(0)} \left(1 + \left(x^{(0)} \right)^2 \right) = \dots \quad (10)$$

(b) Second step:

$$x^{(2)} = x^{(1)} - \frac{1}{2}x^{(1)} \left(1 + \left(x^{(1)} \right)^2 \right) = \dots \quad (11)$$

(c) Third step:

$$x^{(3)} = x^{(2)} - \frac{1}{2}x^{(2)} \left(1 + \left(x^{(2)} \right)^2 \right) = \dots \quad (12)$$

(ii) Examine the convergence

Observation 1. *When studying the convergence of the line search in general or the Newton method in particular, we shall need to know first the minimum x^* of the function $f(x)$, so that we may examine the following expression*

$$\lim_{k \rightarrow \infty} \left| x^{(k+1)} - x^* \right|. \quad (13)$$

Should the scheme converges, the limit results in 0.

By taking into consideration (3) we may compute the extremum

$$\nabla f(x) = \frac{x}{\sqrt{1+x^2}} = 0 \Rightarrow x^* = 0. \quad (14)$$

Then, the extremum $x^* = 0$, which is a local minimum by considering the (4), can be inserted into the (13) to examine the converged ability

$$\lim_{k \rightarrow \infty} \left| x^{(k+1)} - x^* \right| \stackrel{!}{=} 0 \Leftrightarrow \lim_{k \rightarrow \infty} \left| x^{(k+1)} - 0 \right| \stackrel{!}{=} 0 \quad (15)$$

$$\Leftrightarrow \lim_{k \rightarrow \infty} \left| x^{(k+1)} - 0 \right| \stackrel{!}{=} 0 \quad (16)$$

$$\Leftrightarrow \lim_{k \rightarrow \infty} \left| - \left(x^{(k)} \right)^3 \right| \stackrel{!}{=} 0 \stackrel{(\star)}{\Rightarrow} |x^{(0)}| < 1 \quad (17)$$

where (\star) is enabled only if the radius of the starting point $x^{(0)}$ is less than 1. Therefore, it leads us to the following conclusion

- (i) $|x^{(0)}| < 1$: The method will be converged.
- (ii) $|x^{(0)}| = 1$: The method will be oscillating, i.e. by flipping around.
- (iii) $|x^{(0)}| > 1$: The method will be diverged.

Note in passing that we have computed the Newton step in the context of $\alpha_k = 1$ as follows

$$x^{(k+1)} = x^{(k)} + \alpha_k d^{(k)} \tag{18}$$

$$= x^{(k)} - 1 \cdot x^{(k)} \left(1 + \left(x^{(k)} \right)^2 \right) \tag{19}$$

$$= - \left(x^{(k)} \right)^3 \tag{20}$$

4 Demo programming exercise PRU03

(White board + Projector)

Remark 1. *Rosenbrock function*

$$f : \begin{cases} \mathbb{R} \times \mathbb{R} \rightarrow \mathbb{R}, \\ (x, y) \mapsto f(x, y) := a(y - x^2)^2 + (1 - x)^2, \end{cases} \quad (21)$$

where $a = 100$, is well-known in Optimization. It is often used as a test problem for evaluating algorithms in Optimization. This function has a **global minimum** $x^* = 0$ at the point $(1, 1)$.
