## Global exercise - GUE09

Tuan Vo

 $15^{th}$  December, 2022

Content covered:

- ✓ Analysis:
  - (i) Step-by-step with Line integral of scalar field
  - (ii) Step-by-step with Line integral of vector field
- ✓ Numerics:
  - 1. Singular value decomposition (SVD)
  - 2. Demo mini programming exercise (A1-HA09)

**Recall 1.** Line integral of a scalar field  $\phi: \Omega \to \mathbb{R}$  is defined as follows

$$\int_{\Gamma} \phi \, ds := \int_{a}^{b} \phi(\gamma(t)) \|\gamma'(t)\| \, dt \tag{1}$$

**Recall 2.** Line integral of a vector field  $\mathbf{f}:\Omega\to\mathbb{R}^n$  is defined as follows

$$\int_{\Gamma} \boldsymbol{f} \cdot d\boldsymbol{x} := \int_{a}^{b} \langle \boldsymbol{f}(\gamma(t)), \gamma'(t) \rangle dt$$
 (2)

## 1 Step-by-step with Line integral of scalar field

**Example 1.** Examine the following trajectory  $\Gamma = \gamma([0, 2\pi])$ 

$$\gamma: \begin{cases} [0, 2\pi] \to \mathbb{R}^3, \\ (t) \mapsto \gamma(t) := \begin{pmatrix} \cos(t) \\ \sin(t) \\ ht \end{pmatrix}. \end{cases}$$
 (3)

The curve  $\gamma$  is known as the helix. We now would like to compute the total mass  $\mathcal{M}$  of the helix whose density function  $\rho$  defined as follows

$$\rho: \begin{cases} \Gamma \to \mathbb{R}, \\ (x, y, z) \mapsto \rho(x, y, z) := z. \end{cases}$$
 (4)

Approach: By using recall 1.

**Observation 1.** Since the parametrized curve  $\gamma$  from the given trajectory or path  $\Gamma$  is already known, we, therefore, do not have to seek any further parametrized curve. However, in case this information is not yet already given, it is necessary to find such parametrized curve, i.e. the section 2 is such an example.

The mass of the helix is computed as follows

$$\mathcal{M}^{\text{helix}} = \int_{0}^{2\pi} \rho \|\gamma'(t)\|_{2} dt$$

$$= \int_{0}^{2\pi} ht \sqrt{\sin^{2}t + \cos^{2}t + h^{2}} dt$$

$$= \int_{0}^{2\pi} h\sqrt{1 + h^{2}} t dt$$

$$= h\sqrt{1 + h^{2}} \frac{t^{2}}{2} \Big|_{0}^{2\pi}$$

$$= 2\pi^{2}h\sqrt{1 + h^{2}}.$$

## 2 Step-by-step with Line integral of vector field

**Example 2.** Examine the following trajectory  $\Gamma_1$  as shown in Figure 1 from the origin point (0,0) to point (1,1). Besides, the vector field f is given as follows

$$f: \begin{cases} \mathbb{R}^2 \to \mathbb{R}^2, \\ (x,y) \mapsto f(x,y) = \begin{pmatrix} xe^y \\ \sin(x) + y \end{pmatrix}, \end{cases}$$

We would like now to compute the line integral of the vector field  $\mathbf{f}$ , i.e. Work integral/Arbeitsintegral

$$\int_{\Gamma_1} \mathbf{f} \cdot d\mathbf{x}.\tag{5}$$

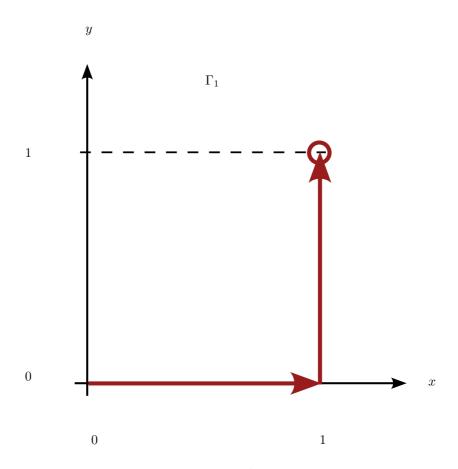

Figure 1: Path  $\Gamma_1$ 

Approach: By using recall 2.

**Observation 2.** There is no parametrized curve for the trajectory  $\Gamma_1$ . Therefore, we shall need to find a parametrized curve for the path  $\Gamma_1$ . Since the path  $\Gamma_1$  is a union of two smaller paths  $l_1$  and  $l_2$ , we obtain the following relation

$$oxed{\Gamma_1 := \mathit{Image}(l_1) \cup \mathit{Image}(l_2)}$$

where the parametrized  $l_1$  and  $l_2$ , and their gradients take the forms

$$l_1(t) := \begin{pmatrix} t \\ 0 \end{pmatrix} \text{ for } t \in [0, 1] \Rightarrow l_1' = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$$
$$l_2(t) := \begin{pmatrix} 1 \\ t \end{pmatrix} \text{ for } t \in [0, 1] \Rightarrow l_2' = \begin{pmatrix} 0 \\ 1 \end{pmatrix}.$$

Substitution of  $l_1(t)$  and  $l_2(t)$  into  $\mathbf{f}$  leads to the following expressions

$$m{f}(l_1(t)) = egin{pmatrix} te^0 \ \sin(t) + 0 \end{pmatrix} = egin{pmatrix} t \ \sin(t) \end{pmatrix}, \ m{f}(l_2(t)) = egin{pmatrix} 1e^t \ \sin(1) + t \end{pmatrix} = egin{pmatrix} e^t \ \sin(1) + t \end{pmatrix}.$$

The line integral of the vector field is computed as follows

$$\int_{\Gamma_1} \mathbf{f} \cdot d\mathbf{x} = \int_{l_1} \mathbf{f} \cdot d\mathbf{x} + \int_{l_2} \mathbf{f} \cdot d\mathbf{x}$$

$$= \int_0^1 \left\langle f(l_1(t)), l_1'(t) \right\rangle dt + \int_0^1 \left\langle f(l_2(t)), l_2'(t) \right\rangle dt$$

$$= \int_0^1 t \, dt + \int_0^1 \left( \sin(1) + t \right) \, dt$$

$$= \sin(1) + \int_0^1 2t \, dt$$

$$= \sin(1) + \left[ t^2 \right]_0^1$$

Therefore, we obtain

$$\therefore \int_{\Gamma_1} \boldsymbol{f} \cdot d\boldsymbol{x} = \sin(1) + 1.$$

## 3 Demo mini programming exercise (A1-HA09)

```
